

**Preserving Extracts through the Point of Delivery; a new end-user activated vape pen!**

**NEW YORK, NY**, Nov 21, 2022 (ASSOCIATED PRESS) 1130 Group, Inc. today announced the recent partnership with a new licensed technology in the inhalation device space. This agreement will be effective on 11/30/22 and will allow 1130 the distribution, and re-licensing of the Clarity Pen® system.

Inhalation consumption of cannabis extracts allow for a quick onset of relief. Making it an attractive remedy for those weaning off opioids and other narcotics. In addition, due to discrete nature can be used throughout one's ADLs (average daily living) activities.

When hand-held vaporizers gained mainstream acceptance in the e-cig industry, cannabis operators quickly turned to try and fill the cannabinoids into the device for sale. The compounds used in a cannabis extraction were far different from the added and reintroduced methods the e-cig space was seeing, with-it carrier agents and artificial flavorings. Despite these first concerns, manufacturing overseas along with cannabis operators begun to tailor and critique these devices to properly inhale cannabis extracts. Immediately after, the traditional "Japanese cotton" was tossed and traded in for a ceramic cell heating element. Today, even (6years later) this style of pre-filled (activated) cartridges keeps a 510 threaded connector and are still the most popular.

Soon after, industry leaders were once again led to the e-cig industry and adopting "all-in-one" disposable devices, as well as prefilled pod-based systems, seen in popular juicy e-cig companies. Once again, with no regard for the end-user still oftentimes receiving inconsistent performance with pre-leaching or leaking seen before receiving.

After years of development and IP protection, the Clarity Pen® system engaged global leaders to confirm these deficits the inhalation technology was lacking. When used to transport and store medical extracts. The end-user has been lacking the efficacies of the compounds due to the degradation the "pre-activated" cartridges were contributing to. In fact, these "pod" or "510 thread carts" systems seen founded from the e-cigarette industry; one not known for medicinal properties. "Therefore, it was clear from the start that these devices would not hold up to FDA requirements the maturing industry was destined to see in the cannabis inhalation sector" states 1130 Groups Chief Innovation Officer, Daisy Jian.

The Clarity Pen® inhalation device allows end-users to obtain a borosilicate glass lab ampoule storing extracts from the lab. They then can take control and interface the ampoule with a 510-thread chassis, activating the medicine at the point of delivery. "We've seen, and heard everything from pre saturated coils clogging, leaking, metal leaching, and terpenoid / flavonoids degradation prior receiving them, which make the Clarity Pen ® a game changer," noted Kenneth Cree of CVC, a NY State Reservation Cannabis Operator.

Scheduled for the end of November 2022, 1130, Group plans to solidify its channel partners throughout the regulated states in the US. They offer licensed producers the ability to store and transport their extracts from the clean room directly to the end-user while working with the industry standard 510 thread connector. "Production for us processors will never come easier," said Cree. ..."The Clarity Pen system offers producers a hands-off, fully automated control, filling and hermetically sealing the ampoules in our certified clean room," added Cree. This is seen as a drastic change from the noncompliance filling and sealing process still involving heat guns and manual labor.
